DAY'S

AMERICAN READY RECKONER:

CONTAINING

TABLES FOR RAPID CALCULATIONS

OF

AGGREGATE VALUES, WAGES, SALARIES, BOARD,
INTEREST MONEY,

TIMBER, PLANK, BOARD, WOOD, AND LAND
MEASUREMENTS,

WITH

EXPLANATIONS OF THE PROPER METHODS
OF

RECKONING THEM,

AND

SIMPLE RULES FOR MEASURING LAND.

By B. H. DAY, Esq.

THESE TABLES ARE WHOLLY ORIGINAL, AND HAVE BEEN CAREFULLY
REVISED BY AN EXPERT MATHEMATICIAN.

NEW YORK:
DICK & FITZGERALD, PUBLISHERS.

in the Clerk's Office of the United States District Court for the
Southern District of New York.

DAY'S AMERICAN READY RECKONER.

INTRODUCTORY AND EXPLANATORY.

A RELIABLE Ready Reckoner is handy to have in the house. I have endeavored to make this one not only accurate, but simple, and easily understood. The Tables in it have been prepared with much care and labor, and they differ somewhat from any heretofore published. Those of Aggregate Values give three rates complete on each page, which is much more convenient than the old method of scattering the rates along from page to page half through the book. In all the Tables fractions are reckoned this wise: less than one half a number is not counted at all, and a full half, or over, is counted one. For example, nine pounds of sugar, costing $10\frac{1}{2}$ cents per pound, comes to $94\frac{1}{2}$ cents. In the Table it is set down at 95 cents: but had the amount been but $94\frac{1}{4}$ or $94\frac{3}{8}$ cents, it would have been reckoned 94 instead of 95. This is practicable enough for any small transactions.

In the Tables of Aggregate Values, (pages 6 to 57,) the number of articles is reckoned from 1 up to 100, and the prices range from $\frac{1}{8}$ th of a cent up to one dollar. When the number to be reckoned runs over 100, add the value of 100 to the value of the number over, thus: How much will be the cost of 164 bushels of corn at $87\frac{1}{2}$ cents per bushel. We know without reckoning that 100 bushels come to $87\frac{1}{2}$ dollars. Set that down, and refer to the Table for the cost of 64 bushels, (\$56,) which added to \$87 50, makes \$143 50. Suppose, on the contrary, it was only 64 bushels, and wheat instead of corn, worth \$1 $87\frac{1}{2}$ per bushel. Any one can tell without figuring that 64 bushels at one dollar per bushel is \$64. Set that down, and then refer to the Table for the price of 64 bushels at $87\frac{1}{2}$ cents per bushel, (56,) which, added to the \$64, makes \$120.00 as the aggregate value of the wheat.

In working the Tables, find the value of the article to be reckoned at the head of a column, and pass your finger down that column until opposite the *Number*, (on the side column,) of articles bought or sold, and that figure is the correct aggregate value of that particular number of articles.

VALUES PER OUNCE. P. 58-60. The cost, in "Cents per pound," of articles to be reckoned, is on the left hand side column, and the number of ounces reckoned is at the top of each of the other columns. For example: if you buy or sell five ounces of an article at 52 cents per pound, pass your finger down the column headed 5 oz. until opposite number 52 on the side column. You have there the cost of 5 ounces.

WAGES BY THE WEEK. P. 61-68. The wages are given at the top of each column, and the reckoned number of days and weeks are on the left hand side column. Find the column headed with the amount of weekly wages you are to receive or pay, and pass your finger down until opposite the number of days or weeks to be reckoned: you have there the amount of the wages.

WAGES BY THE MONTH. P. 69-85. These Tables work in the same way as those for wages by the week. Half and quarter days are not usually reckoned in monthly wages. First count the odd days over an even month, and find the amount of wages for that number of days: then find the wages for the even months, and add the two amounts together.

SALARIES BY THE YEAR. P. 86-97. Proceed in same manner as in wages by the month, above described.

BOARD BY THE WEEK. P. 98-105. Find the amount agreed upon, per week, at the head of a column, and pass your finger down that column until opposite the number (on left side column) of days or weeks to be reckoned, where you will find the correct amount of the board.

INTEREST TABLES. P. 106-137. Find the number of dollars to be reckoned, and the rate of interest, at the head of a page, and pass your finger down the proper column until opposite the number of days or months (on left side column) that you wish to cast interest for, and you will there find the aggregate amount of the interest. If the interest is for one or more months, and some odd days over, first set down the amount for the months, then

find the sum for the days, and add the two together. Should the amount to be reckoned exceed 100 dollars, add the interest on 100 dollars to the interest on the amount over that sum. If over 200 dollars, set down the interest on 100 dollars twice, and add these two sums to the interest on the amount over 200 dollars, and so on; or you can multiply the interest on 100 dollars by the number of hundreds for which you wish to reckon.

TIMBER, PLANK AND BOARD MEASURE. P. 138-171. The working of these Tables is very similar to that of those already described, and each sett is introduced by an explanation of the proper method of reckoning the results given in the Tables.

WOOD MEASUREMENTS. P. 172-177. These Tables give the quantities of wood in piles of various shapes and sizes. Measure the height and length of your pile in feet and inches, and then find the same height on the left hand column of one of the Tables. Pass your finger straight across the page until you come to the right measurement of the length of your pile. At the top of that column you will find the quantity of wood in the pile.

VALUES BY THE DOZEN AND GROSS. P. 178-184. These work similar to the Tables of Aggregate Values. First ascertain by them the cost of the even dozens you may wish to reckon, and set down the amount. Now find the value of the number of articles over even dozens, and add the two together.

LAND MEASUREMENTS. P. 189-191. These Tables give the dimensions in yards of various quantities of Land in different shapes, and we think they plainly explain themselves: but for fear they should not be fully understood, here is an example.—Look at the beginning of page 190. Three acres of land are set down as 81 yards wide by 179 long: the next lot of three acres is 82 yards by 177: the shape of the next is 83 by 175 yards: the next 84 yards by 173, and so on down the whole column. Each of the two dimensions in that column represent the measurements, in yards, of three acres. A farmer who desires to lay out three acres of land for planting, paces off the number of yards across his lot, and referring to the table, looks out a corresponding number, either by length or width. The requisite number of yards to be paced the other way is by the side (in the table) of the number already paced.

THE MEASUREMENT OF TIMBER.

SCANTLING, or Timber for building, is sold by the square foot of inch board measure. Thus a cubic foot of scantling, which is a foot wide, a foot thick, and a foot long, contains twelve feet measurement. To ascertain the square feet in a piece of scantling of any length, width and thickness, multiply the width in inches by the thickness in inches: then multiply the product of these figures by the length in feet and divide the second product by 12: the quotient is the number of feet, and the remainder (if any) is the odd inches. Six inches and over are usually reckoned as an extra foot.

In measuring the length of a piece of timber, the lumberman counts even feet only. Unless the length is full ten inches or more over an even number of feet, the excess is not counted; but ten inches over are counted as a full foot. In marking the contents of a piece of timber when it runs over measure, the lumberman usually places a mark at the spot where the measurement ends. The marks are made on one end of the stick with Roman capital letters instead of figures, as XXI for 21, XVIII for 18, and so on.

EXAMPLE. Suppose a stick of timber to be 11 inches in width, 9 inches thick, and to measure 26 feet in length:

Multiply.....11...the width

by..... 9...the thickness.

Product,.... 99...by which

multiply. 27...the length in feet.

693

198

Divide this product by...12)2673

Quotient....222.9 remainder.

The quotient is the number of square feet (inch board measure)—the 9 remainder being the odd inches. As six inches and over are counted a foot, 223 feet are the contents of the stick.

BOARD MEASURE.

BOARDS are sold by the square foot surface, one inch in thickness. If cut thinner, they count the same as if an inch thick.—To ascertain the number of square feet in a board, multiply the width in inches by the length in feet, and divide the product by 12: the quotient is the number of feet in the board, and the remainder is the odd inches. Six inches and over, remainder, are counted an additional foot. For example, measure a board 22 inches wide by 19 feet long, as per margin:

Multiply..22..the width in inches,
by....19..length in feet.

198

22

12)418...Product.

Quotient..34..10 Remainder.

Showing 34 feet 10 inches in the board, which counts 35 feet.

TABLES OF PLANK MEASUREMENTS.

PLANK is sold by the square foot of inch board measure, and the contents are reckoned in the same manner as those of Building Timber, described on page 138. But when the thickness of a Plank varies in half or quarter inches, the process of figuring up the measurement is a little different.

EXAMPLE. Suppose a Plank to be 22 feet long, 9 inches wide and $1\frac{3}{4}$ inches thick. First reduce the thickness to $\frac{1}{4}$ fractions, of which $1\frac{3}{4}$ gives 7.

The Tables we subjoin give the aggregate number of feet in any Plank, reckoning the fractions above 50 as an extra foot, and not counting those at all which do not reach half a foot. This is the general custom of lumber dealers.

All our lumber tables are simplified so as to require little or no explanation.— It will be seen here that the length of the plank is given on each side, and the width and thickness at the top of the table. To ascertain the contents of any plank, find the size of it at the top, and pass your finger down that column of figures to the line opposite the side figure representing the length of your plank:— the number on that line is the number of feet in the plank.

Multiply the width...9...inches,
by the thickness...7...quarter inches.
Product...63...which multiply
by...22...the length in feet

126
126

Second Product,..1386

Add two ciphers to this second product to bring in the fractions, and then divide it by 4, thus:

4)138600

Then divide by..12) 34650..Quotient.

2887..2d Quotient.

The second quotient shows the contents of the plank, viz.: 28.⁸⁷/₁₀₀—counting 29 feet.

CONTENTS OF 1 1/4 INCH PLANK OF various lengths, reckoned in square feet, inch board measure.

CUBIC MEASUREMENT OF TIMBER.

HEWED TIMBER for framing buildings, and for building bridges, docks, ships, &c., is sold by the solid cubic foot; and the contents of each stick, when measured by the lumberman, is marked on the butt with a broad-axe in Roman capital letters. For example, a stick containing nineteen feet is marked XIX, one of twenty feet XX, twenty-one feet XXI, and so on. A cubic foot is a measurement one foot long by a foot thick each way, or the equivalent thereof; hence a stick of timber a foot square will count one cubic foot to each foot of its running length. In reckoning the cubical contents of a stick of timber, if it should run less than half a foot (or 50-100ths) over an even number of feet, the excess is not counted; but a full half, or any fraction above it, is counted an extra foot. To ascertain the contents, proceed as follows: Measure the thickness of the stick each way in inches, and multiply one by the other: then multiply the product by the length in feet. Divide the second product by 12, and then divide the quotient by 12. The second quotient is the number of cubic feet. For example: Take a stick of timber of the size 13 by 14 inches and 41 feet long.

Multiply...	14
by.....	13
	42
	14
Product..	182
Length . .	41 feet.
	182
	728
2d. Prod.	7462

To bring in, and include, the fractions of a foot, add two cyphers to this second product, and then divide by 12, thus:

The two first figures of the	12) 746200
second quotient (51) are the num-	12) 62183.. Quotient.
ber of feet in the stick, and the	5181.. Second Quotient.
two last figures (81) represent the	
fractions, viz., 81-100ths. Hence the stick contains 52 cubic feet	
—half a foot (50-100ths) and over counting an extra foot.

LOGS REDUCED TO SQUARE TIMBER.

TO RECKON the contents of a round log in cubic feet of square timber, first reduce it to square timber thus: Measure the diameter (or thickness) at each end, in inches; add these measurements together, and divide the sum total by 2; the quotient is the average diameter. One third of this diameter is allowed for the chips or slabs. To deduct this third, divide the number of inches diameter by 3, and subtract the quotient from it:—the remainder is the proper diameter for measurement. The thickness of the log is generally counted in even inches; and one-third of an inch excess, or upwards, is added as an extra inch. After getting the square of the log in manner above described, the number of cubic feet in it is reckoned the same as in square timber, (see page 155.) But as in the reduction of logs fractions of inches often have to be reckoned, an example may be useful for a perfect understanding of it.

EXAMPLE. Suppose a round log to be 35 feet long, 24 inches thick at the butt and 19 inches thick at the top :

Add....24
and...19...the two diameters.

Sum total....43...to which add two ciphers to include the fractions, and then divide by....2)4300

Deduct $\frac{1}{3}$ for 3)21.50...average diameter.
slabs. 7.17

True diameter..14.33...or, $14\frac{1}{3}$ inches.

Reduce this to thirds thus: three times 14 is 42—and the odd one makes 43 thirds.

Multiply.....43
by.....43
129
172

Total.....1849.....which represent
ninths of inches. Add two ciphers to include the fractions, and then, to reduce to inches, divide by 9 :

9)184900
205.44

Multiply by... 35...the length of
102720 the log.
61632

Divide by..12)719040

Divide by...12)59920 a second time.

Cubic feet.....49.⁹³/₁₀₀ counting 50 feet.

CUBIC MEASUREMENT OF ROUND TIMBER.

THE following may properly be called LOG TABLES, as they give the number of solid (or cubic) feet in logs of different lengths and thickness. They apply to all kinds of round timber sold by the solid foot.

To reckon the number of cubic, or solid feet in any log, ascertain its average thickness in manner given on page 162. Multiply this diameter in inches by an equal sum; then deduct 1-4th from the product, and add 5 per cent. to the remainder. Multiply the sum total by the length of the log in feet, and divide the product by 12; then divide the quotient by 12 as in square timber described on page 155. The second quotient is the number of solid (or cubic) feet and fractions thereof which the log contains.

EXAMPLE. Suppose a log 23 feet long to be 29 inches thick at the butt, and 26 inches thick at the small end :

Add together..... 26	
and.... 29	
Divide by..... 2) 5500	.. adding two
Average thickness.... 2750	ciphers to
Multiply by the same. 2750	bring in
1375	fractions.
1925	
Deduct $\frac{1}{4}$ from 550	
this product. 4) 75625	
Add 5 per cent. 18906	
or 1-20th... 20) 56719	
2836	
Square of the log.. 59.555.. or 59. $\frac{56}{100}$ in.	
Multiply this by the length 5956	
of the log in feet..... 23	
17868	
11912	
Divide the product by... 12) 136988	
Divide the quotient by... 12) 11415	
Contents of the log..... 95 $\frac{11}{100}$ feet.

TABLES OF WOOD MEASUREMENTS.

THE following Tables show the contents of piles of Wood of almost any shape, from one-tenth of a cord up to five cords. When the pile to be measured varies in height in different places, measure all these heights in inches, add them together, and then divide the sum total by the number of your measurements: The quotient is the average height; and if the remainder is equal to one half, or over, of the divisor, add one to the quotient. When the pile slopes gradually from one end to the other, it is only necessary to measure the height at each end, add the two measurements together, and divide by 2: the quotient is the mean height. Having thus ascertained the average height of the pile in inches, divide the number by 12, when the quotient and remainder will show the height in feet and inches. Now find the length of the pile, and the table will show you the quantity of wood it contains. These tables measure eighths of cords only. Should the length of your pile run over any length here set down, and not be equal to the next figure (or eighth of a cord,) it is easy enough to halve or quarter the difference between the two figures—the half representing one-sixteenth, and the quarter one-thirty-second of a cord, &c. In this way the tables may be made available for a pretty close measurement.

To measure an irregular pile of wood without the aid of the tables, first ascertain the average height in inches, in the manner above described, then multiply the length in inches by the height, and divide the product by 576: the quotient represents eighths of cords: and if the remainder is equal to 288, or over, add 1 to the quotient. Less than 288 remainder, or half the divisor, is not counted. You can then divide the quotient by 8, and the second quotient and remainder represent cords and eighths of cords.

When wood is corded for measurement, the piles should be an even number of feet both in height and length. Multiply the length by the height, in feet, and divide by 32: the quotient is the number of cords. Divide the remainder by 4 and the second quotient is eighths of cords.

WOOD MEASUREMENTS....showing the widths and heights of
Piles of Wood of different shapes and quantities.

VALUES BY THE DOZEN AND GROSS.

THESE TABLES show the values of articles that are priced by the dozen or gross. For example: if a store-keeper asks so much a dozen for Eggs, or so much per gross for buttons, you can refer to the tables and find the cost of a single one, or of any number less than a dozen, or less than a gross, as the case may be.

THE MEASUREMENT OF LAND.

IN measuring large tracts of Land surveyors generally use the metal chain called Gunter's Chain. It is twenty-two yards long, and divided into one hundred links of $7\frac{92}{100}$ inches each. In ordinary land measurements, however, tape lines, with the links marked and numbered thereon, are preferred, being less costly, and much more portable and convenient. The tape has likewise marked on it the number of the feet, (sixty-six,) which are subdivided into tenths of a foot, instead of inches, to facilitate exact measurements by decimals.

Although the outside measurement is reckoned in running chains and links, the contents are estimated by acres, roods, perches, (sometimes called poles or rods,) yards, and links. Square measure is always understood in these estimates. Nine square feet, (or a square piece of land measuring three running feet on each of the four sides,) make one square yard: there are thirty and a quarter square yards in a perch: forty perches make one rood, or quarter acre: four roods to an acre. There are six hundred and forty acres in a square mile, which is a piece of land measuring one mile on each of the four sides, or the equivalent thereof when the piece is differently shaped.

An Acre is ten square chains, or a piece of land 3 chains $16\frac{1}{4}$ links (or about $69\frac{1}{2}$ yards) on each of the four sides, or, if shaped differently, as much land as is included in that compass. Thus, if the acre measures only 3 chains in width, it should be 3 chains $33\frac{1}{3}$ links long. Or, if it is an oblong piece 2 chains wide, it should be 5 chains long to make the ten square chains requisite for an acre—five times two being ten, &c.

A Rood is a quarter of an acre, or forty perches. It contains 25,000 square links, and if it is a square piece of land it should measure 1 chain 58 links (or about $34\frac{3}{4}$ yards) on each side.

A Perch (160th of an acre) contains $30\frac{1}{4}$ square yards, or 625 square links, and measures $5\frac{1}{2}$ yards, or 25 running links of the chain, on each of the four sides.

The measurement of land by chains and links, being simply a system of decimals, may be easily understood by any one who has learned the four simple rules of arithmetic, and who will keep in mind that the outside measurements are estimated by running chains and links, while the contents are reckoned by square chains and links—the latter being a multiple of the former, as explained below.

Thus, a perch of land, measuring 25 links in length, and the same in breadth, contains 625 *square* links, because 25 times 25 are 625. Or, a rood of land, measuring 1 chain $58\frac{1}{4}$ links in length by 1 chain 58 links in breadth contains 25,000 square links, because $158\frac{1}{4}$ multiplied by 158 gives 25,000 as the product.

A running chain contains 100 links, as before explained, but it takes 10,000 square links to make a square chain, because 100 times 100 is 10,000. And as an acre comprises ten square chains, it must necessarily contain 100,000 square links.

In taking the dimensions of a piece of land, first measure the length, setting down the chains and links in one sum—then ascertain the breadth and set that down underneath: multiply the first sum by the last, and the product is the contents of the lot—the last five figures (tens of thousands) representing links, and the rest of the figures full acres. Set down the acres separately, and reduce the links to roods and perches as follows: Divide them by 625, and the quotient is the number of perches, the remainder being the odd links: divide this quotient by 40, and the second quotient represents roods, and the second remainder perches. Set down this second quotient and remainder after acres, and after them set down the first remainder (odd links.) You will thus have in one sum the proper measurement of the land in Acres, Roods, Perches and Links. If you desire to set down Yards also, divide the Links by $20\frac{1}{2}$: the quotient will represent Yards, and the remainder, Links.

In measuring the land, draw your chain straight across hills and hollows, as the surface of undulations is not counted, but the measurement in all cases must be on a straight line. When the lot of land varies in width or length, measure it in the several places where the variations occur, setting down each measurement. Add them all together, and divide the sum total by the

number of your measurements. The quotient is the average, or proper measurement.

EXAMPLE. Suppose a piece of land to measure 9 chains and 65 links in length by 7 chains 91 links in breadth:

$$\begin{array}{r}
 \text{Multiply} \dots 965 \\
 \text{by} \dots 791 \\
 \hline
 965 \\
 8685 \\
 6755 \\
 \hline
 7.63315 \\
 \text{Acres. Links.}
 \end{array}$$

$$\begin{array}{r}
 \text{Divide Links by } 625) 63315 (101 \text{ Perches, which divide} \\
 \begin{array}{r}
 625 \\
 \hline
 815 \\
 625 \\
 \hline
 \end{array}
 \end{array}$$

$$\begin{array}{r}
 \text{by} \dots 40) 101 (2 \text{ Roods.} \\
 80 \\
 \hline
 21 \\
 \text{Perches} \dots
 \end{array}$$

Odd Links. 190 . . . and there being 20% links to the square yard . . . Divide the Odd Links by 20%) 190 (9 Yards.

$$\begin{array}{r}
 186 \\
 \hline
 \text{Remaining Links} \dots \dots \dots 4
 \end{array}$$

Contents—7 Acres, 2 Roods, 21 Perches, 9 Yards, 4 Links.

In places where neither chain nor tape can be procured, land is sometimes measured with a notched pole $16\frac{1}{2}$ feet long. There should be 24 notches on the pole, cut at even distances apart, which will make the space between them a trifle over $7\frac{7}{8}$ inches. This leaves 25 spaces, which are links, and the pole represents a quarter chain. In notching the pole first mark it off with a pencil, to be certain that the spaces are exactly alike before cutting the notches. These links should then be numbered from 1 to 25 on the pole with pen and ink.

In measuring hilly lands run an air line across the face of the earth as near as possible. Surveyors have a compass (similar to a quadrant) supported by a tripod, by which they determine a straight line over the surface, allowing also for the curvature of the earth. This instrument is necessary in measuring large tracts, and for exact measurements anywhere. It is very simple, and the working of it is easily learned.

In writing out a Deed of Land, the number of chains and

links are mentioned in describing each boundary, and the contents are specified in acres roods and perches. It is only where the land is of considerable value that the odd yards and links are added. In measuring farms, a full half perch or more is called a perch, and less than half a perch is not counted: hence the phraseology "more or less," which ends the description in most deeds. The proper way to describe a piece of land in drawing a deed is as follows: John Smith (we will suppose) owns land on the south side of the lot to be deeded, and David Brown's land bounds it on the north side: the west side fronts the public road, and the east side intersects land belonging to the Estate of Samuel Jones Esq.

Land of David Brown.				
Public Road.	Breadth, 8 Chains, 30 Links.	Length,	8 Chains, 30 Links.	Estate of Sam'l Jones.
		12 Chains,		
		50 Links.		
Land of John Smith.				

deceased. This piece of land comprises, say about ten acres, shaped as the diagram hereto annexed:—The Deed should describe it as follows:

"Beginning at a point on the east side of the public highway (naming the road, if it has a name) at the south-west corner of land owned by David Brown: running easterly, parallel with the land of said Brown, twelve chains and fifty links, to land belonging to the heirs of Samuel Jones—thence southerly, parallel with the land of said heirs, eight chains and thirty links, to land of John Smith Esq.—thence westerly, twelve chains and fifty links, to the public road (naming it)—thence northerly along said road or highway to the place of beginning:—Containing Ten Acres, One Rood and Twenty Perches of Land, be the same more or less."

LAND TABLES FOR PLANTING.

Farmers who lay out lands for planting purposes frequently measure by yards instead of chains and links, as it is more convenient to pace off the yards than to use surveying tools. For the benefit of these people we give some tables, showing the lengths and breadths, in yards, of pieces of land in different shapes. These tables do not give fractions of yards; but where the measurement runs over an even yard, for half a yard or more, an extra yard is added. Less than half a yard is not counted. Hence they are not sufficiently accurate for permanent measurements, but will answer very well for planting purposes.

PLAN OF THE SURVEYS OF THE PUBLIC LANDS.

The Public Lands of the United States are laid out in Ranges of Townships, which run longitudinally, and are numbered on the map in Roman numerals (capital letters.) The Townships run in lines from West to East, all those on a line bearing the same number. Thus, the line of Townships running along the northern boundary of a State would be all number one, those on the line underneath, number two, &c., the duplicate numbers being distinguished by the different ranges. Each Township is

6	5	4	3	2	1
7	8	9	10	11	12
18	17	16	15	14	13
19	20	21	22	23	24
30	29	28	27	26	25
31	32	33	34	35	36

surveyed into 36 Sections of 640 acres, or one square mile, the numbers of the Sections being arranged like those on the diagram here given. One of the centre sections of each township is reserved by the Government to be appropriated for the support of schools and colleges.

This is the general plan on which the Public Lands of the United States are laid out and surveyed. The details may vary a little in some of the older states, but not materially.

HOW FREE FARMING LANDS ARE ACQUIRED.

The Pre-emption Laws of the United States give, free of cost, (except ten dollars for the survey,) to an actual settler, 160 acres of land worth \$1.25 per acre, or 80 acres worth \$2.50 per acre. A person applying for this free land must be a citizen, or have filed his or her declaration in Court of an intention to become a citizen of the United States—must be 21 years of age, or if not so old, must have served in the army or navy. Or, a person not 21 years old, who is at the head of a family, may have the benefit of this law. After living on the land five years, they will be given a patent, or deed of it, from the Government. Disloyal persons, or any one who has borne arms against the United States are excluded from the benefits of the law.

THE END.
